

Implementing a Quality Intervention* for Patients With Clinical Characteristics of **Advanced Polycythemia Vera**

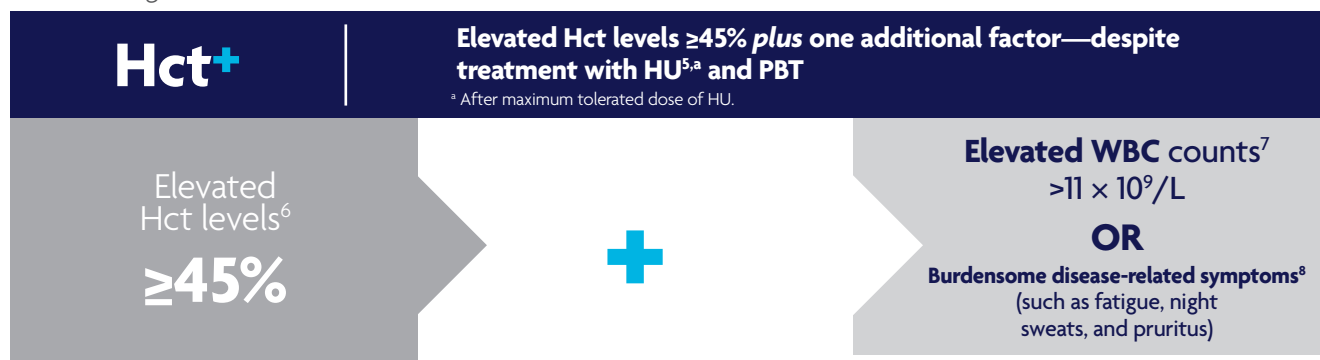

A guide for US healthcare professionals responsible for population-based decision making

Help clinicians identify the subset of patients with clinical characteristics of advanced polycythemia vera (PV)

*The elements of the quality intervention described have not been validated or approved for securing accreditation or reimbursement, nor has the information been supported or endorsed by any entity for these purposes.

Clinical characteristics of advanced PV

PV is a hematologic malignancy that may become advanced in a subset of patients despite treatment with HU and PBT, resulting in ineffective disease control.¹⁻⁴

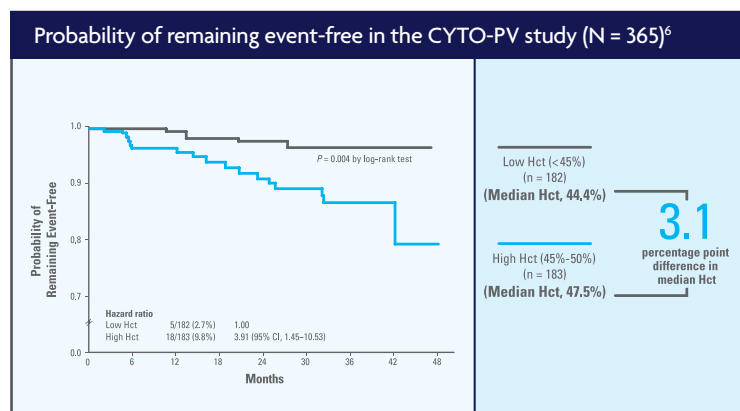

Hct, hematocrit; HU, hydroxyurea; PBT, phlebotomy; PV, polycythemia vera; WBC, white blood cell.

Patients with clinical characteristics of advanced PV are at increased risk of thrombosis

CYTO-PV study

►► Elevated Hct between 45% and 50%: 4-fold higher rate of cardiovascular death and major thrombosis⁶

- Managing Hct levels between 45% and 50% significantly increased the risk of cardiovascular death and major thrombosis compared with an Hct level managed to <45% (HR, 3.91; 95% CI, 1.45-10.53; $P = 0.007$)^{6,a}

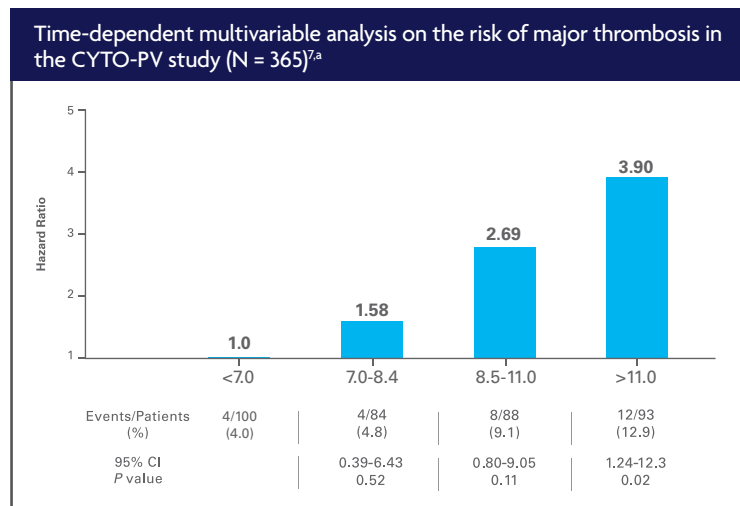

CI, confidence interval; CYTO-PV, Cyto-reductive Therapy in Polycythemia Vera; Hct, hematocrit; HR, hazard ratio; HU, hydroxyurea; PBT, phlebotomy.

^aIn the CYTO-PV study of 365 adult patients with PV treated with PBT, HU, or both, patients were randomized to 1 of 2 groups—either the low-Hct group (n = 182; with more intensive therapy to maintain a target Hct level <45%) or the high-Hct group (n = 183; with less intensive therapy to maintain a target Hct level of 45% to 50%). Baseline characteristics were balanced between the groups. Approximately 50% of patients had received an initial diagnosis of PV within 2 years prior to randomization. 67.1% of patients (n = 245) were at high risk because of age ≥ 65 years or previous thrombosis. The composite primary endpoint was the time until cardiovascular death or major thrombosis.⁶

Kaplan-Meier curves for primary composite endpoint. From *New Engl J Med*, Marchioli R, Finazzi G, Specchia G, et al; CYTO-PV Collaborative Group. Additional analysis from the CYTO-PV study

►► Elevated WBC counts $>11 \times 10^9/L$ increased the risk of thrombosis⁷

- In a multivariable time-dependent analysis, WBC counts $>11 \times 10^9/L$ were associated with increased risk of thrombosis (HR, 3.9; 95% CI, 1.24-12.3; $P = 0.02$)⁷

- In this analysis, there was a trend for increased risk of thrombosis with WBC count $>7 \times 10^9/L$ (ie, HR >1) that became statistically significant in patients with WBC counts $>11 \times 10^9/L$ ⁷

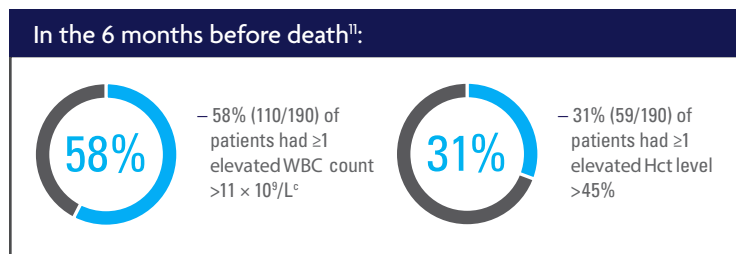

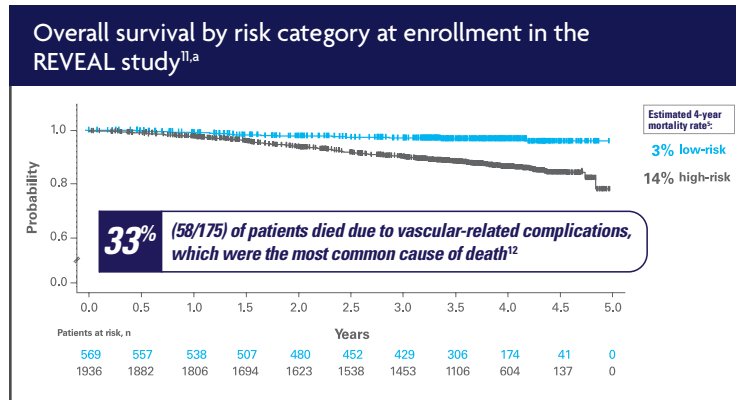

- These results are consistent with other literature that suggests leukocytosis may increase the risk of thrombosis^{9,10}

CI, confidence interval; CYTO-PV, Cyto-reductive Therapy in Polycythemia Vera; Hct, hematocrit; HR, hazard ratio; WBC, white blood cell.

^aAdjusted for age, gender, cardiovascular risk factors, previous thrombosis, and Hct levels.⁷

The estimated 4-year mortality rate was 14% in patients with high-risk PV in a prospective, observational study^{11,a}

REVEAL study

- 86% of high-risk patients (1660/1940) received HU and/or PBT at enrollment¹²

ELN, European Leukemia Net; Hct, hematocrit; HU, hydroxyurea; PBT, phlebotomy; PV, polycythemia vera; WBC, white blood cell.

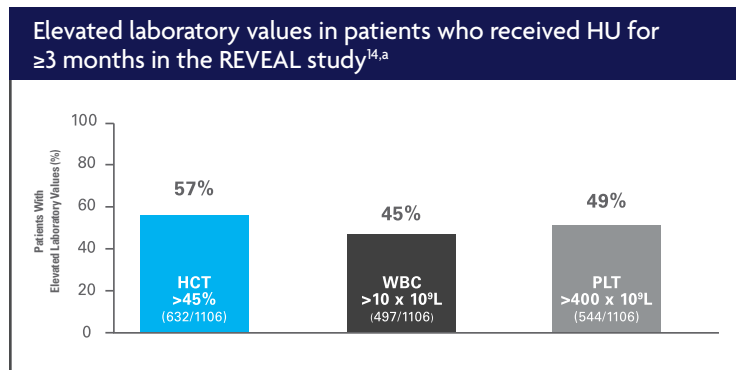

^a77% of patients (1940/2510) were classified as high risk at enrollment based on age ≥ 60 years and/or history of thrombotic events.¹²

^bREVEAL was a prospective, observational study of 2510 adult patients with PV in the United States, sponsored by Incyte. Patients were enrolled over an approximate 2-year period (July 2014 to August 2016). This analysis included all enrolled patients and evaluated characteristics of deceased patients, survival by risk, and causes of death over the course of the study. A total of 244 patients died during the study, with 190 having elevated Hct values and WBC counts in the 6 months before death, and 175 having a known cause of death. Among the 244 patients who died during the study, 82% (n = 200) were categorized as high risk at diagnosis, primarily due to age ≥ 60 years only (65%; n = 159).¹¹

^c71% (78/110) of these patients did not experience an infection in the year prior to death.¹³

Some patients with PV continued to have elevated blood counts, despite treatment with HU¹⁴

REVEAL study

- The median of the maximum Hct value among evaluable patients (n = 1106) who received HU for ≥ 3 months was 48% for those who reported a value $>45\%$ and 42% for those who reported a value $\leq 45\%$ ¹⁵

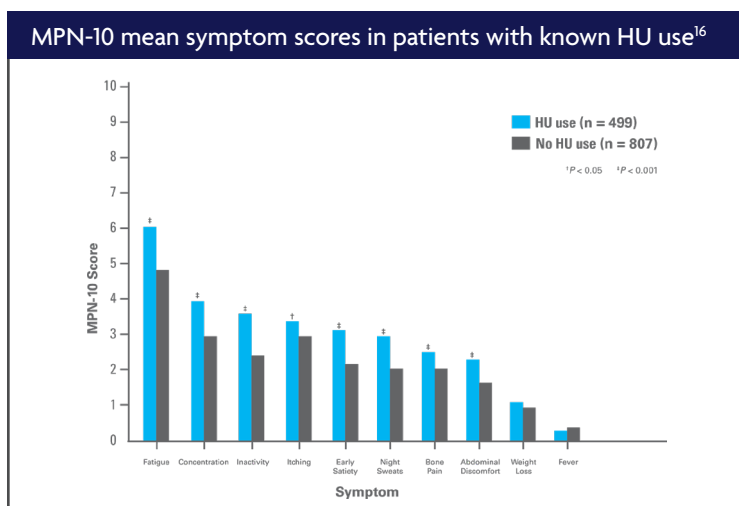

Hct, hematocrit; HU, hydroxyurea; PLT, platelet; PV, polycythemia vera; WBC, white blood cell.

^aREVEAL was a prospective, observational study of 2510 patients with PV in the United States, sponsored by Incyte. This analysis focused on blood count control in the subset of 1381 patients who had received HU for ≥ 3 months.¹⁴

Analysis included patients with all 3 laboratory values.¹⁴

On average, patients with known HU use had moderately high symptom burden (TSS = 29.2)¹⁶

Symptomatic Profiles of Patients With Polycythemia Vera: Implications of Inadequately Controlled Disease, *Journal of Clinical Oncology*, volume 34, issue 2, pages 151-159, <https://ascopubs.org/journal/jco/> © 2015 American Society of Clinical Oncology.

PV-related symptoms are prevalent and associated with altered cytokine signaling, blood hyperviscosity, and splenomegaly^{8,a}

Cytokine-related:

- 88% Fatigue
- 62% Pruritus
- 61% Inactivity
- 52% Night sweats
- 50% Bone pain
- 31% Weight loss
- 18% Fever

Hyperviscosity-related:

- 65% Concentration problems

Splenomegaly-related:

- 64% Early satiety
- 51% Abdominal discomfort

- A prospective study of 1334 patients with PV, where a subset of patients received HU (n = 499)^{16,a}

In the MPN Landmark Survey,^b

66%

of patients with PV reported that their symptoms reduced their quality of life.^{17,c}

HU, hydroxyurea; MPN, myeloproliferative neoplasm; MPN-10, MPN Symptom Assessment Form; PBT, phlebotomy; PV, polycythemia vera; TSS, Total Symptom Score.

^aA prospective study of 1334 patients with PV was conducted to assess baseline symptoms with certain disease features: known HU use (n = 499), known PBT (n = 646), palpable splenomegaly (n = 369), or all 3 features (n = 148), and compared to a control group of patients that lacked the specified feature. Assessment of MPN symptoms was performed by using the MPN-Symptom Assessment Form Total Symptom Score (MPN-SAF TSS; MPN-10). All items were evaluated on a 0 (absent) to 10 (worst imaginable) scale. The MPN-10 TSS has a possible range of 0 to 100 with 100 representing the highest level of symptom severity. The TSS for each patient was analyzed to place the patient into the quartiles of low symptom burden (TSS, 0 to 7), intermediate symptom burden (TSS, 8 to 17), moderately high symptom burden (TSS, 18 to 31), or high symptom burden (TSS, ≥32).¹⁶

^bThe MPN Landmark Survey, funded by Incyte Corporation, was a web-based questionnaire composed of 65 multiple-choice questions intended to help evaluate the patient disease burden in the MPN disease setting. A total of 813 patients in the United States with a previous diagnosis of MF, PV, or ET completed the survey (MF, n = 207; PV, n = 380; ET, n = 226).¹⁷

^cPatients reported whether they strongly agreed, somewhat agreed, somewhat disagreed, or strongly disagreed with the following statement: PV symptoms reduce my quality of life.¹⁷

^aThis prospective study included a total of 1433 patients with MPNs (n=538 with PV), who were queried on the 10 symptoms from the MPN-SAF TSS/MPN-10. The MPN-SAF TSS is validated for serial tracking of the most pertinent MPN-related symptoms—fatigue, concentration problems, early satiety, inactivity, night sweats, itching, bone pain, abdominal discomfort, weight loss, and fever—scored on a scale of 0 (absent/as good as it can be) to 10 (worst imaginable/as bad as it can be), for a total possible score of 100.⁸

NCCN Clinical Practice Guidelines⁸ in Oncology (NCCN Guidelines[®]) for Myeloproliferative Neoplasms¹⁸

recommend assessing symptoms (in a provider's office) at baseline and monitoring symptom status (stable, improved, or worsening)

Changes in symptom status could be a sign of disease progression

NCCN, National Comprehensive Cancer Network.

Actively monitor patients for **Hct+**

Proactively identify the subset of patients with clinical characteristics of advanced PV

Hct+

Elevated Hct levels $\geq 45\%$ *plus* one additional factor—despite treatment with HU^{5,a} and PBT

^aAfter maximum tolerated dose of HU.

- In the CYTO-PV study, **elevated Hct** between 45% and 50% was associated with a 4-fold higher rate of cardiovascular death and major thrombosis compared with Hct $< 45\%$ ⁶
- In an additional analysis from the same study, **elevated WBC counts** $> 11 \times 10^9/L$ increased the risk of thrombosis⁷
- Symptom burden in patients with PV is substantial and may not be adequately controlled with HU¹⁶

CYTO-PV, Cytoreductive Therapy in Polycythemia Vera; Hct, hematocrit; HU, hydroxyurea; PBT, phlebotomy; PV, polycythemia vera; WBC, white blood cell.

Use EHR systems to identify patients with clinical characteristics of advanced PV

- 1 Select the **query, report, or list tab** within your system
- 2 Enter ICD-10 Code **D45** for PV
- 3 Select drug: **Hydroxyurea**

Review the list for patients with **Hct+**:

Elevated Hct $\geq 45\%$, phlebotomy, *plus* one additional factor:

- **WBC count $> 11 \times 10^9/L$, or**
- **Burdensome symptoms** (eg, fatigue, night sweats, and pruritus)

- Clinical criteria such as diagnosis, medication, and blood counts can be used proactively to identify the subset of patients with clinical characteristics of advanced PV
- These patients may require a different management approach. Monitor your EHR system regularly, and notify clinicians of patients who have the clinical characteristics of advanced disease

Contact Incyte for information on how to use your EHR system to implement a quality intervention for patients with clinical characteristics of advanced PV
